

Myths about stuttering

Myth: People who stutter are not smart.

Reality: There is no link whatsoever between

stuttering and intelligence.

Myth: Nervousness causes stuttering.

Reality: Nervousness does not cause stuttering.

Nor should we assume that people who stutter are prone to be nervous, fearful, anxious, or shy. They have the same full range of personality traits as those who

do not stutter.

Myth: Stuttering can be "caught" through

imitation or by hearing another person

stutter.

Reality: You can't "catch" stuttering. No one

knows the exact causes of stuttering, but recent research indicates that family history (genetics), neuromuscular development, and the child's environment, including family dynamics, all play a role

in the onset of stuttering.

Myth: It helps to tell a person to "take a deep

breath before talking," or "think about

what you want to say first."

Reality: This advice only makes a person more

self-conscious, making the stuttering worse. More helpful responses include listening patiently and modeling slow

and clear speech yourself.

Myth: Stress causes stuttering.

Reality: As mentioned above, many complex

factors are involved. Stress is not the cause, but it certainly can aggravate

stuttering.
